
Antennas And Wave Propagation By John D Kraus 4th Edition Free 15

The branded text, often referred to as the "Antenna Bible", now also covers the basics of wave propagation in its fourth edition. Unlike ordinary words, an antenna is a medium for transmitting waves. Antennas are made up of very short wavelength metal pins called filaments. They can be made from wire, wire, or plastic. The ends of the antenna point outward and are connected to a device that works to receive signals. This device, called the "receiver," can be internal or external.
