That is because the traditional keylogger uses a pretty simple method. The malware is installed on a userâ►►s computer after she downloads it from the Internet, or it is downloaded by an employee when his or her computer is connected to the corporate network. This malware is designed to be inserted into any document that is viewed or downloaded from the Internet or from the network. It will then record all keystrokes made on the infected computer. The alternative method used by the malware uses a browser plug-in that is installed on the userâ►►s PC when the user downloads any malicious file, not limited to keyloggers or any malicious program. To prevent these kind of attacks, make sure that you have a security program installed on your computer. In addition, keep a regular check that you are not downloading any suspicious files from the Internet or from the network. Modern software development practices require that the software should be designed for testing with a variety of input conditions. Testing the software with all such possible variations is known as testing with inputs, and that exercise is known as the inputs experiment. The inputs experiment is a testing strategy of first writing the test code, and then testing the test code. In an inputs experiment, the
