After the installation, the Autodesk software will automatically open a Welcome screen, as shown in the following figure: Impaired sex hormone binding globulin-estradiol relationships in postmenopausal androgens treated women. The steroid hormone relationship of sex hormone binding globulin (SHBG) and estradiol (E2) was evaluated in 10 normal postmenopausal women and 11 women on postmenopausal androgen replacement therapy (TRT). All women were treated with low doses of medroxyprogesterone (n = 9) or norethindrone (n = 2). Serum levels of SHBG and E2 were determined at different stages of the menstrual cycle. In normal postmenopausal women, there were large variations in the relationship of SHBG and E2 throughout the cycle. This relationship was best described by a polynomial (quadratic) function (r = 0.97). In contrast, in the androgen treated women, there was an impaired relationship between SHBG and E2. In androgen treated women, the changes in E2 were not reflected in corresponding changes in SHBG, and the best fitting model was a polynomial function. These results demonstrate that the steroid hormone relationships of SHBG and E2 are different in normal postmenopausal women and in androgen treated postmenopausal women. This suggests that the response to androgen is dependent upon the state of sex hormone binding globulin.[Prevalence of obesity in the adolescent population of San Lorenzo, Ecuador].
