A procedure for the purification of alginate lyase (EC 4.2.2.3) from Bacillus sp. strain TK 003 has been described in this study. The lyase was purified in a 6-step procedure consisting of ammonium sulfate fractionation, cation exchange chromatography on DEAE Sepharose, affinity chromatography on alginate-Sepharose, gel filtration on Superose 6, and lastly the final purification on hydroxyapatite. Among the different methods tested, the most efficient method was the chromatography on DEAE Sepharose, which yielded a specific activity of 89 U/mg of protein after purification. The DEAE-Sepharose-purified enzyme had a yield of 17% and a specific activity of 99 U/mg.
