DesktopSave is an application designed to take a screen snapshot of a user's desktop settings and export them to a file. This means you can apply your desktop setting to multiple computers to share the same experience in general, and if you need to use multiple computers the next time you log on, you simply load a file and you are back to your good old desktop. DesktopSave can save your desktop settings in 4 different ways: - Regular - It saves your desktop settings one time, which means it will be saved each time you start DesktopSave up until you decide to delete the file. - Temporarily - It applies a single setting and saves it temporarily so that you can later choose to apply the same setting again for when you launch DesktopSave. - All - It saves your desktop settings. However, it applies every setting multiple times, which means it does save quite some settings over the one you had manually. - Quick Save - It goes through the whole process of saving your desktop settings, however it applies your preferences only once, so it does save some of your settings, but not all. DesktopSave also offers several features when it comes to restoring your desktop settings. The application lets you restore your desktop settings on any PC by importing the settings from another PC or by exporting the settings to a file. You can also set up your PC to automatically restore the settings the next time you log on to your computer, which makes it extremely useful if you need to use different computers frequently. with highly detailed character models and new environments.
