I used the app for several months with no problems, until the 4th or 5th installation on my PC running Windows 7. After that installation, any time I ran the app, it would stop responding and take up to 10 minutes to open and load. Since then, I've uninstalled the app and reinstalled it, but I'm still getting the same problems. Zeev- I will look into it. What's New in the?

download mover is a very simple Windows application developed to automatically move user-defined formats from one folder to another. The application was designed to help users who download multiple file formats and want to easily organize the download folder, so it can automatically move specific formats to another target directory. There's nothing that could get you too much trouble because the GUI is actually plain and simple, with only a few clicks required to set it up. You are initially prompted for a folder to be monitored, the target extension and the output folder, while the bottom of the main window allows you to choose the interval to automatically check for new files. In addition, the program can display a notification window whenever some new items are moved to the target folder, but there's no option to configure these messages. The good thing is that download mover remains very light on hardware resources and doesn't affect system performance in any way, running smoothly on every Windows version out there. Administrator privileges are however needed on Windows 7 workstations in case you wish to transfer the downloaded files to a system protected folder. There's no option to start it with Windows whatsoever, so you need to launch the app manually every time. Simply put, download mover is the kind of app that can help a handful of users keep things organized in their download folder, offering just a minimal GUI and basic options to help them in this regard. A "readme" document is also included in the archive, just in case you need more information on a specific built-in feature.
