In conjunction with the developer, the BC is responsible for approving major improvements or repairs to a development, and the act requires that any major work which may affect the health and safety of the public or the property must receive approval by a member of staff on behalf of the BC and the builder. The building inspectors ensure that all major building work is done safely. The legislation introduced the concept of 'licensing' in 2005. Communities are currently becoming more aware of how they can regulate the building and development process themselves with the help of building control. The building inspections process varies from jurisdiction to jurisdiction. For example, in the United Kingdom, building control applies to all new buildings; whereas in Singapore, building control is generally applicable to new residential and small commercial buildings. Canada has a similar system with Ontario and British Columbia, and the United States has the National Fire Protection Association (NFPA) building code as well as rules and regulations from the US Department of Housing and Urban Development for each local agency. In Europe, local authorities are not responsible for building control. With the passing of legislation in 2006 that allowed for larger scale developments, the legislation of building control has become more effective. This has also been helped by the European Building (Amendment) Regulations 2007, which were introduced in 2008. Building control is not a new concept, however it became more effective after the Building Act 1989. The Building (Amendment) Act 2006 and the Building (Amendment) (No. 2) Order 2006 reformed the Building Act
