I have a client who is changing an old system that stores data. They are storing all the history of records so they can quickly get it back if they need to. My question is, can the data be removed from the database and just maintain the history? Or is there something bad about keeping a history of the data in the database? It means that you can roll back to an older version, or forward to a newer version. Without it, the data would be "brittle", so to speak. It will also mean that you have to maintain two sets of data. If you are doing some housekeeping on the data, but then must go back and fix an earlier problem, you need to find out what data you don't care about. You also need to have a way to connect the history with the present. They should be referenced in some way, either directly in a table in your database, or you might have some other system somewhere that's actually keeping the data, and you can reference the two sets of data in those. This may be easier to do if you use the SQL Server integration features, which will automatically build those "links" for you. But you'll still need to maintain them, and possibly help your clients with it. A: Yes. It's okay to keep history of deleted rows if necessary (such as you might do a migration, or remove a table you don't need anymore, or...) and there's not problem at all. However, keep in mind that the application that uses the database (which is the one that keeps the history of any deleted rows) can be forced to go and look at these deleted rows, and maybe even remove them if you're not careful. So if you're working on
