But why this update? Did Adobe want to make its Photoshop app really stand out? Did it want to take its place as a useful software solution for photographers? As we review, we will notice that it seems to be still selling big numbers. In fact, according to its most recent figures, if we include Photoshop Elements, Lightroom and Photoshop, Adobe actively sells more than one million copies of its software per quarter. Yeah, and it all may change in the next few months as people begin to upgrade to work with Lightroom 5. But of course, since nobody has done this before, we have to report what is currently available. Let's first take a look at the most important changes after more than six months of development on this latest version. Some of the Photos View tweaks could, I believe, justify an upgrade, especially the possibility of creating a Tagged Set from a selection. But there are also some minor issues. Let's take a quick look at these one by one. Although the changes are minor, they could end up being extremely important in terms of the usability of a key feature. Want to check all the changes that Lightroom 5 brought to Photos? Check out the official Lightroom 5 Release Notes These are the sub-sections to check for any major performance issues that might hinder the use of the program. It is probably my longest review of Adobe's newest version, and, by the way, my longest review of any Lightroom since Lightroom 4.x. "The majority of Photoshop customers run Lightroom in a single-user environment on a fast machine with multi-disc storage," says Nick. "Upgrading to other versions of Photoshop can become a resource-intensive task. Lightroom 5 has been carefully designed to improve performance when users perform some of the most common tasks in the software, such as splitting a catalog into multiple catalog groups. These performance improvements are enabled by a new engine called the Batch Processing Engine, which was introduced in previous versions of the software."

With the new update, they are no longer going to be separate layers, but will instead be an array of paths that cross each other in complex ways. We are unsure of how this will change the way we use Photoshop and not sure if it will cause us to update a bunch of how layers work. A simpler way to understand it is that it might change how things are merged together, and avoid certain graphic design invidious merge behavior. It might also mean we could ditch our library of filter layers for the new ones.
